

# Model categories, dg categories, and derived Hall algebras

Julie Bergner

April 6, 2006

## **Abstract**

I will describe an application of model category techniques to representation theory, namely, the definition of a derived Hall algebra. Hall algebras can be used to recover partial information about quantum groups. The so-called derived Hall algebra is a natural extension of this notion, but model category techniques are needed to prove its associativity. The talk will be fairly expository.
